Inventory of Housing Stock in the Lower Pioneer Valley Regional Planning District of the municipalities in the two Counties of Hampden and Hampshire. Analysis of total housing units in terms of occupancy status, size, distribution, overcrowding, condition, age, value, tenure, and type of structure.

Public and subsidized housing programs are outlined along with data on housing authority organization and formation. This housing is inventoried in terms of numbers of units, age, funding agency. Mapped locations are also provided.

HOUSING INVENTORY

Prepared by

The Lower Pioneer Valley Regional Planning Commission

as part of the

Urban Planning Assistance Project MA 01 06 1005 1971

The preparation of this report was financially aided through a Federal grant from the Urban Renewal Administration of the Department of Housing and Urban Development, under the Urban Planning Assistance Program authorized by Section 701 of the Housing Act of 1954, as amended; by a State Regional Planning Assistance grant administered by the Massachusetts Department of Community Affairs, and by contributions from member municipalities of the Lower Pioneer Valley Regional Planning Commission.

#### PREFACE

The Lower Pioneer Valley Regional Planning District (LPVRPD) was established in 1962 under Chapter 40B of the General Laws of Massachusetts. The purpose of the regional planning law is to permit cities and towns to plan jointly "to promote with the greatest efficiency and economy the coordinated and orderly development of the areas within their jurisdiction and the general welfare and prosperity of their citizens." The Commission's 1,182 square-mile area of jurisdiction covers the 43 municipalities in the counties of Hampden and Hampshire with a combined 1970 federal census population of 583,031 people and 187,449 housing units.

In order to understand the problems and prepare adequate housing proposals for the regional planning district, an ongoing inventory of the historic and present conditions of housing stock is necessary, in order to obtain insight into the dynamics of the housing system and ensure better planning for the future. In 1965, the Commission engaged the services of consultants to undertake a Housing Inventory of the 30 municipalities in the planning area at that time. That inventory was based mainly on 1960 census data with updating to 1965 by building permits issued, and utility company records. This HOUSING INVENTORY updates data where possible to 1970 census information, and deals with such subjects as public housing, low and moderate income housing, subdivision and apartment development, as a basis for a regional approach to analyzing housing needs, particularly the needs of low and moderate income families.

The Inventory is one of several studies being conducted by the Commission in the field of housing under the current planning program. Others include: HOUSING ELEMENT, which is updated and revised annually to point up regional problems and obstacles, and Commission objectives, planning and implementing activities; RESIDENTIAL DEVELOPMENT PATTERNS AND CONTROLS; and LOCATION OF LOW AND MODERATE INCOME HOUSING SITES, based on an analysis of Chapter 774 of the General Laws of

Massachusetts.

These studies are not undertaken solely in fulfillment of the Commission's annual work program commitments. They are intended to provide a framework:

- to which local community development can relate, as an aid in planning residential and urban growth;
- as the basis for the Commission's areawide comprehensive planning certification, and functional water, sewer, and open space planning certification, which ensures the eligibility of individual member municipalities for federal funding; and
- as the regional context within which the Commission undertakes its A-95 review responsibilities, now a pre-requisite to any consideration for funding for over one hundred major federal programs, and all state-assisted housing and urban development programs.

#### I. SCOPE AND SUMMARY

#### A. Scope

Housing is one of the more important aspects of the urban growth pattern and comprehensive information is needed to develop the regional plan for the area. Knowledge of the housing stock and its characteristics is essential for the development of a sound plan of regional growth. Factual information on the size, distribution and nature of the housing supply, as well as recent trends in the housing market all help to indicate the direction of housing development and population distribution. This housing inventory updates and extends the 1965 Housing Inventory for the region, and its value in the future will be greatly enhanced if the information is periodically updated.

The inventory covers the 43 municipalities of Hampden and Hampshire Counties in the Lower Pioneer Valley Regional Planning District. The information presented in this report serves a variety of purposes. First, it is part of the work program for the Regional Plan. In addition, it provides an aid to the numerous local planning efforts throughout the region. The report is primarily addressed to all those responsible for guiding the regional planning programs and to their planners and technicians. Local officials concerned with city and town development should find it useful, particularly in relating their community development to that of the region.

An inventory, by definition, deals with a large array of data, and as such, it lists and analyzes a considerable volume of housing information for all the communities within the area of study. Inevitably, the report provides many tables to document housing in the region. To present the facts in a manageable form the body of the report generally provides only sub-area summaries; the detailed information for the 43 municipalities is combined in a comprehensive set of tables in the Appendix.

The prime source of information is the United States Census of Housing for the years 1950, 1960 and 1970. The

inventory deals with the total number of housing units, occupied housing units, and vacant housing units. The housing characteristics section provides data on a community basis on owned and rented dwelling units, single and multifamily units, the room size of dwellings, and the age of dwelling structures. The final section of the report deals with public and subsidized housing units constructed throughout the region and presents overall estimates of the current need for additional units. It is felt that while the regional planning process is an aid to both private and public agencies, it is in the public sector where the implementation of regional planning must be supported by responsible public actions. In the housing field, the private market can be relied upon to meet the needs of the middle and upper income families, but the provision of low income housing is a public responsibility. If the region, along with the rest of the nation, wants to eliminate poor housing and ensure that no family shall pay an unreasonable amount of its income for housing, then public action in the housing field cannot be avoided.

#### B. Summary

In 1970 there were 187,449 housing units in the region. Approximately 95,000 units (50.6%) were located in the CUC --central urban core area. The increase from 1960 to 1970 for the region was 10.9 percent -- significantly slower than the 29.6 percent increase which took place between 1950 and 1960, reflecting a much lower population increase.

Between 1960 and 1970 the central urban core of three cities had an average annual increase of only eight housing units. The two satellite cities of Northampton and Westfield combined had an average annual increase of 185 units. The remaining 38 towns had an average annual increase of 1,630 housing units clearly a "flight to the suburbs". The east suburban (ES) area not only had the largest increase (8,400 units) but most of it was in single family unit construction. By contrast 6,000 of the west suburban (WS) increase of 7,200 units were in multi-family structures.

As the population of the regions grows, so does housing, and as the population is redistributed throughout the region, so new housing development tends to adapt to the changing demand. However the rate of increase in housing units exceeded the population increase between 1960 and 1970, due to the steady decline in the average number of persons per household. This average for the region declined from 3.2 persons per household in 1960 to 3.1 persons per household in 1970. The decline does not necessarily mean a decline in family size, but rather the fact that families set up their own homes earlier than they used to, and single persons show a preference for living on their own, e.g., the one person households increased by 6,622 over 1960.

Occupied housing units increased by only 21,113 between 1960 and 1970 compared with 31,568 units between 1950 and 1960. But owner-occupied units increased 19 percent over 1960 while renter-occupied units increased 9 percent.

The 1970 vacancy rate for the region amounted to 2.8 percent of the total housing stock, well below the 5.4 percent vacant and available in Massachusetts. There were 4,521 units (2.4%) vacant and available for rent in the region, 3,251 of them (72%) were in the central urban core. This represents a vacant for-rent rate of 3.4 percent for the CUC -- the highest rate for any of the region's sub-areas. In view of the shortage of housing in the region, this high figure for the CUC appears to reflect the general undesirability of the rental units available.

As a general rule, cities and towns with the least or no population growth such as Springfield and Holyoke had the highest vacancy rates, whereas many of the suburban towns, which grew at a faster pace, showed vacancy rates of under two percent.

The data on building permits issued by municipality shows that 1971 was a "good" home building year. Permits for 6,313 units were issued in 1971, the largest number over the past twelve year period. Since 1968 the number of multi-family permits have outnumbered single family permits. While the

total number increased from 1,883 in 1960 to 6,313 in 1971, the increase reflects increased activity in multi-family construction, 330 multi-family permits were issued in 1960 compared to 4,183 permits in 1971.

As of 1970 approximately 60 percent of the occupied housing units in the region were owned. This was slightly higher than the state with 57.5 percent. Home ownership in the suburbs remains high while the cities of the region with three-quarters of all rental units continue to have the highest proportion of renter-occupied housing.

Renter occupation is largely a function of income. Of all the renter-occupied units in the Springfield-Chicopee-Holyoke Metropolitan area, 40 percent of the households had incomes of less than \$5,000 in 1970. Further, households with incomes under \$7,000 account for only 23 percent of owner-occupied units, whereas the same income grouping occupies 56 percent of the rental units. At the other end of the scale, households with incomes of over \$10,000 occupy 58 percent of the owned units and 23 percent of the rent units. Only the middle income group of \$7,000 to \$9,000 owned and rented housing units equally.

From the increased number of permits issued for multifamily structure in recent years and even with expected rising
incomes it appears that a large proportion of the region's
households will have to rely on rental accommodations. This
applies particularly to the nonwhite households. In 1970,
about 65 percent of nonwhite households lived in rental units
in the region, while only 32 percent of white households
lived in rental accommodations.

In 1970, 54.5 percent of the region's housing stock was in one-unit structures, and 45.4 percent in two-or-more unit structures. The highest percentage increase in apartments occurred in the ES and WS sub-areas.

A very high portion of the region's total housing units were in the medium size range of four to six rooms. Almost 71 percent of the units were in this size range in 1970 a larger proportion than in the state. Because of this high

proportion of medium size housing, the proportion of units with three rooms or less, and seven rooms or more were below the levels for the state. The critical point is the potential shortage of larger units in the region.

The 1970 census does not provide information on sound, deteriorating, and dilapidated units as the 1960 census did. According to the 1960 census over 3,600 units were classified as dilapidated and over 18,000 additional housing units were classified as deteriorating because of various defects that should be corrected to provide safe and adequate shelter. In effect, over 18 percent of the 1960 housing stock in the region did not meet the National Housing Goal of "a decent home .... for every American family." But certain items from the 1970 census provide an indication of inadequacy: Plumbing facilities 5,050 units in the region lack some or all plubing facilities; overcrowding 6,370 units have more than 1.01 persons per room; and age approximately 55 percent of the region's housing stock was built in 1939 or earlier, which makes them over thirty years old.

One-third of all owner-occupied housing units in the region, for which values were tabulated, are in the \$15,000 to \$20,000 price range as compared with one-quarter for the state. In terms of high value units (\$25,000 and over), the region has 17.6 percent of its units in this price category compared with 30.8 percent for the state. But the east suburban subarea has 36.2 percent of its total units valued at over \$25,000. Clearly, low and middle value units are predominant in the rest of the region, dropping to 8.4 percent in the central cities.

In rental accommodations the region also has a higher proportion of the units in the middle value range than the state. Approximately one-half of its rental units are in the \$60 to \$100 rent range and the remaining one-half are divided almost equally below \$60 rent per month and above \$100 per month. But while the region has 26.7 percent of its units renting for over \$100 a month, the state has 51.7 percent.

Of all the rental units in the Springfield-Chicopee-Holyoke SMSA, 16,260 or 25 percent were occupied by households with incomes under \$3,000 in 1970; 87 percent of these house-holds were paying 20 percent or more of their income for housing, and over 74 percent of them (12,075 households) spent over 35 percent of their income on rental housing. This is not surprising since 20 percent of an annual income of \$2,000 allows only \$35 a month for rent; regardless of the size of unit, the region had only 3,388 units that rented for \$40 or less.

According to the guidelines established for admission to family public housing, low-income families should pay no more than one-fifth of their income for housing. If households with family incomes of \$3,000 to \$5,000 are considered, this adds about another 9,100 households paying more than 20 percent of their income for rent.

These difficulties are further emphasized in the inventory of housing for nonwhite families. Nearly all the nonwhite housing is concentrated in the three central cities, mainly in Springfield. In 1970, some 6,790 units were occupied by non-white households in the central urban core with only 592 units in the rest of the region. The average number of persons per room for non-whites was higher than that for whites. Nearly a quarter (1,600) non-white owner occupied units were overcrowded and over a half (3,800) non-white renter-occupied units were overcrowded. For the 364,523 white (non-negro) population in occupied units, 63,358 (18.6%) live in over-crowded conditions. For the 23,355 non-whites in occupied units, 5,451 (22.5%) live in overcrowded conditions.

There are 5,167 units of low rent public housing in the region at the present time under management by a local housing authority. They are provided by 16 of the 43 municipalities. Approximately one-half of the units (2,561 units) are for the elderly and the remaining one-half were constructed for either veterans or low-income families. Of the total public housing units, 75 percent are provided in the three central cities and 85 percent in the 5 cities of the region. Of all the public housing units constructed since 1960, almost 65 percent were constructed for the elderly. Only Springfield and Chicopee have built any non-elderly public housing since 1960.

Overall estimates indicate that the existing stock of public housing fails to meet the needs of the region. On the evidence available, it appears that the region needs 6,000 to 8,000 additional units of low-rent housing. The existing stock of public housing is inadequate to deal with the region's low-income families. If the national goal is to be attained, serious efforts must be made to provide decent housing and concerted action must be taken by the region under the guidance of the regional planning commission. There is no other agency which is in a position to forecast housing development throughout the two-county area, assess the regional needs for public programs and assist in their integration at the local level.

Α.

## II. SOURCES, DEFINITIONS AND AREA OF STUDY Sources:

The United States Census of Population and Housing provides the most extensive, official, and uniform housing information for the region. For many of the housing characteristics, it is the only source of information. All of the housing data presented for the years 1950 and 1960 has been assembled from published and unpublished census material. The 1970 census information was obtained as available from the 1st through the 4th Count Census Summary Tapes—which includes a considerable amount of census data that will not be made available in the Bureau of the Census publications for general use. In addition, for consistency, the 1965 HOUSING INVENTORY report by the Commission was used for the original 30-municipality area.

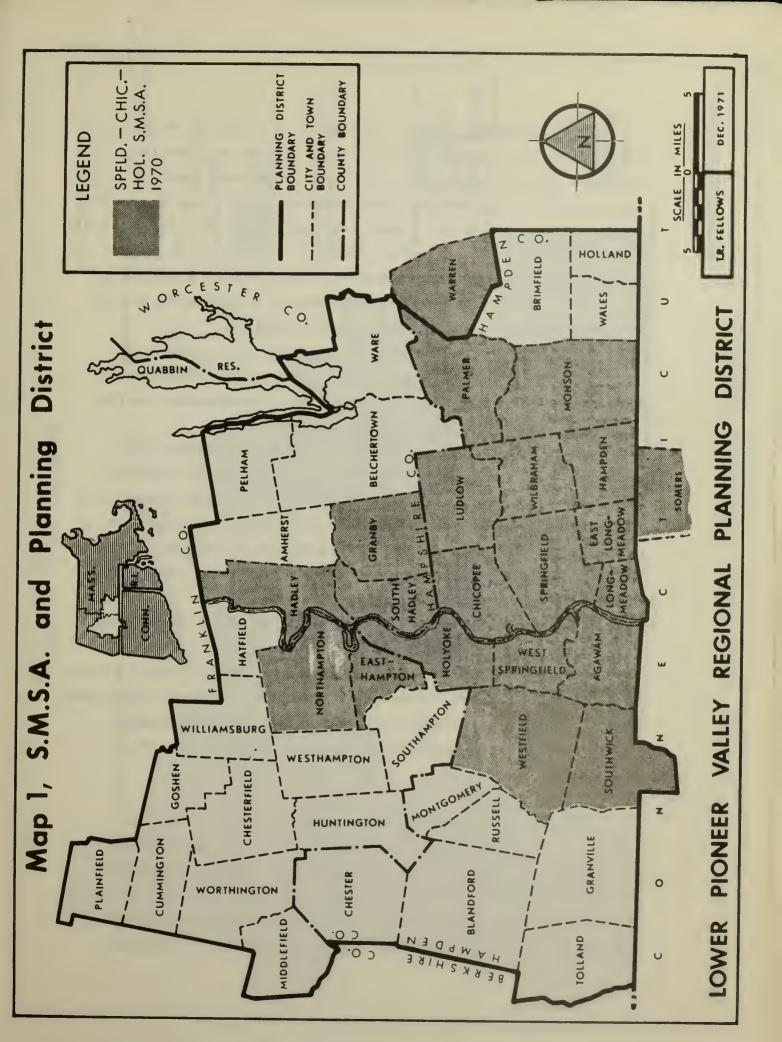

#### B. <u>Definitions</u>:

Standard Metropolitan Statistical Area (SMSA): In New England, an SMSA is a city or group of cities and towns containing at least one city (or "twin cities") of 50,000 or more population, plus any adjacent cities and towns which are metropolitan in character (and economically and socially integrated with the central city or cities.) The central cities are used to identify the SMSA. In this region, therefore, referral will be made to the Springfield-Chicopee-Holyoke SMSA which includes the municipalities of Somers in Connecticut and Warren in Worcester County, Massachusetts.

Housing Units: Housing units comprise houses, apartments, groups of rooms, or single rooms, which are occupied, or vacant but intended for occupancy, as separate living quarters.

Occupied Housing Units (Households): A unit is occupied if it is the usual place of residence of the person(s) living in it at the time of enumeration. Included are units occupied by persons only temporarily absent.

<sup>&</sup>lt;sup>1</sup>Source: U. S. Census, 1970

Vacant Housing Units: Generally a unit is vacant if no persons are living in it at the time of enumeration. However, units temporarily occupied by persons having a usual place of residence elsewhere are classified as vacant; whereas units where the usual residents are only temporarily absent are not classified as vacant.

<u>Value of Unit</u>: An estimate of how much the property would sell for on the current market or (for vacant units) the asking price at the time of enumeration.

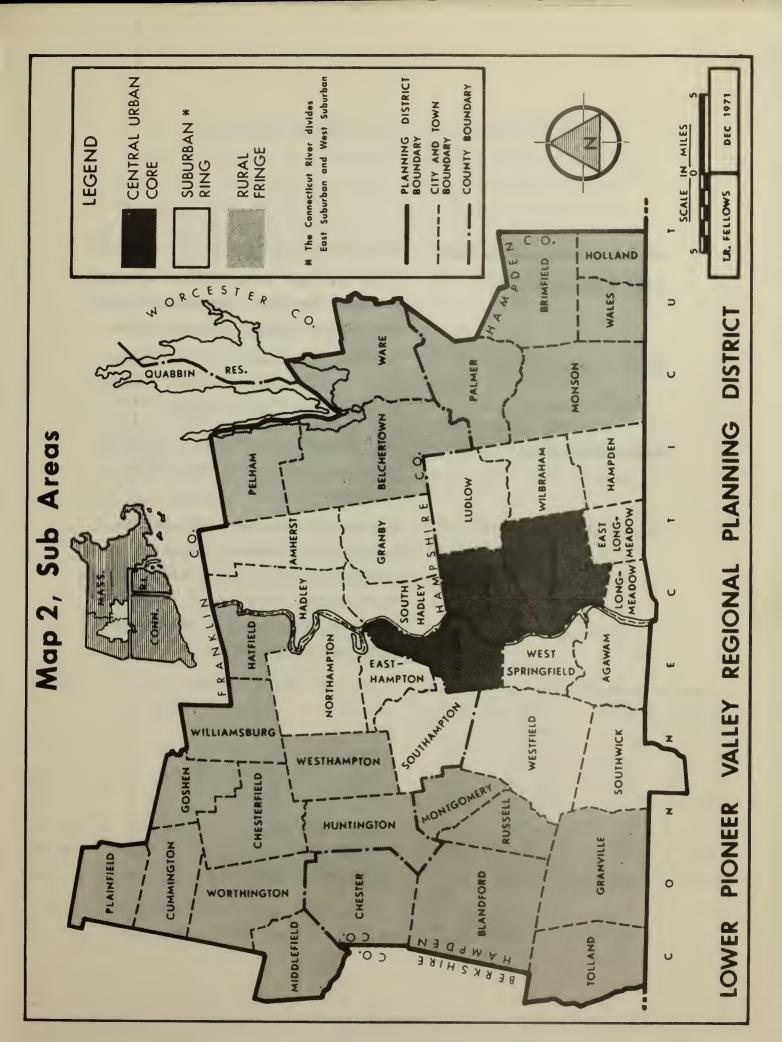

Contract Rent: The monthly dollar rent agreed upon or (for vacant units) the monthly dollar rent asked at the time of enumeration, regardless of any furnishings, utilities, or services that may be included.

Gross Rent: For renter-occupied units rented for cash rent. Represents the contract rent plus the average monthly cost of utilities and fuels, to the extent that these are paid for by the renter in addition to the rent. Gross rent thus eliminates differentials which result from varying practices with respect to the inclusion of utilities and fuel in contract rent.

Rooms: Rooms to be counted include whole rooms used for living purposes—such as living rooms, dining rooms, kitchens, bedrooms, finished recreation rooms, family rooms, etc. Not counted as rooms are bathrooms, porches, balconies, foyers, halls, half-rooms, kitchenettes, utility rooms, unfinished attics, basements, or other spaces used for storage.

#### C. Area of Study:

The Planning District (see Map 1) consists of two Counties—Hampden and Hampshire—with 43 municipalities which comprise the Lower Pioneer Valley Regional Planning District (LPVRPD). For the collection and analysis of data, the District has been broken down into 5 sub-areas for closer analysis of detailed data (see Map 2) as follows:

Central Urban Core (CUC): Springfield, Chicopee and Holyoke

East Suburban (ES): Amherst, East Longmeadow, Granby,

Hadley, Hampden, Longmeadow, Lud-

low, South Hadley and Wilbraham

West Suburban (WS): Northampton, Westfield, Agawam,

Easthampton, Southampton, South-

wick and West Springfield

East Rural (ER): Belchertown, Brimfield, Holland,

Monson, Palmer, Pelham, Wales

and Ware

West Rural (WR): Blandford, Chester, Chesterfield,

Cummington, Goshen, Granville,

Hatfield, Huntington, Middlefield,

Montgomery, Plainfield, Russell, Tolland, Westhampton, Williams-

burg and Worthington

#### III. TOTAL HOUSING UNITS - OCCUPIED AND VACANT

This section of the HOUSING INVENTORY deals with total numbers of housing units, single and multi-family structures, occupancy and population figures, and vacancy figures for sale and rent. This data and analysis are presented in order to see the region and its sub-areas in the perspective of state figures and to disclose significant implications for regional development patterns.

#### A. Housing Stock 1950, 1960 and 1970

From 1950 to 1960 the region's housing stock increased by 38,674 units, from 1960 to 1970 by 18,237 units—an increase of less than a half of that of the previous decade. For the same periods, the figures for the state show an increase of 290,000 between 1950 and 1960 and 200,000 between 1960 and 1970—an increase of over two-thirds that of the previous decade.

This compares with population increases from 1950 to 1960 and 1960 to 1970 of 77,017 and 50,449 for the region, and 458,064 and 540,592 for the state.

Source: U. S. Census of Housing 1950, 1960, and 1970

(for individual municipal figures, see Table I, Appendix)

The significance of these figures lies in the abrupt cessation of growth, over 1960 to 1970, in the central urban core in terms of housing units, compared to the relatively constant increase in the number of housing units over the two decades for the suburban and rural communities, with the eastern half of the region maintaining a consistent lead over the western half. Further, from this table and from the individual community figures shown in Table I, Appendix, it can be shown that between 1960 and 1970 the central urban core had an average annual increase of eight housing units; the two satellite cities of Northampton and Westfield combined had an average annual increase of 185 units; while the remaining 38 towns had an average annual increase of 1,630 housing units—clearly a "flight to the suburbs."

The implications for regional land use development patterns are considerable.

Just as significant are the figures shown in Table 2.

Source: U. S. Census of Housing 1960, 1970

(individual municipal figures are not given in the Appendix, but are available in the Commission's office)

The east suburban area has not only shown the largest increase (8,400 units), but most of it has been in single-family unit construction. By contrast 6,000 units of the west suburban growth of 7,200 units have been in multi-family structures, while the central urban core has shown an increase in single-family units almost all offset by the decrease in multi-family structured units.

Again, the implications for regional land use development patterns are considerable.

#### B. Occupied Housing Units 1950, 1960 and 1970

Occupied housing units in the region increased (see Table I, Appendix) by 31,568 (25.1%) between 1950 and 1960, and by 21,113 (13.5%) between 1960 and 1970. This is an average annual increase of 3,157 units for the earlier period and 2,111 units over the last decade. The figures for 1960 and 1970 are shown in Table 3.

TABLE 3

Source: U. S. Census of Housing 1960, 1970

(for individual municipal figures, see Table I, Appendix)

It can be seen that the increase in the number of occupied units was highest in the suburban areas, which has affected the distribution of occupied housing units within the region. Map 3 illustrates occupied housing units in 1970 in the region by municipality.

#### C. Changes in Population and Occupied Housing

This increase in occupied housing units is related to the increase in population and the population forming households (see Table 4).

TABLE 4

Source: U. S. Census 1960, 1970

(for individual municipal figures, see Table II, Appendix)

<sup>\*</sup>The difference is due to people in group quarters, i.e. students, military personnel, and other institutional inmates.

While population for the region over 1960-1970 grew by 50,449 (9.5%), the number of people forming households grew by only 42,288 (8.3%), because of the increased number of people in group quarters, which can readily be shown to be an increase of 8,161 (31.1%).

If households had remained the same size (i.e. with the same number of persons per household) in 1970 as in 1960, clearly the number of occupied units would have increased at the same rate: that is at the rate of 8.3%.

However, because of the trend of young singles and newly-married couples setting up home sooner than they used to, and because more single and elderly people also tend to live on their own, there has been a gradual reduction in the number of persons per household—from 3.2 to 3.1 over the period 1960 to 1970 (see Table 5). This apparently insignificant change, which follows a statewide trend, in fact has profound implications for the housing situation, contributing to the increased number of occupied housing units from 1960 to 1970 of 21,113 units, or a 13.5% increase. The main impact, of course, is felt in the critically low vacancy rates that prevail.

(for individual municipal figures, see Table III,
 Appendix)

Within the sub-areas of the region the average size of households in the suburbs and rural areas is slightly higher than in the central cities, where more single persons and young childless couples live. But generally, the trend is to fewer persons per unit, except in the west rural sub-area.

An understanding of housing must center around factors relating to families and households. The difference in the terms must be clarified, since they are often and erroneously used interchangeably. According to the 1970 U.S. Census "housing units are occupied by either "families" or "primary individuals." The term "family" refers to the head of a household and all (one or more) other persons living in the same household who are related to the head by blood, marriage or adoption. If the head lives alone or with non-relatives only, then the head is considered a "primary individual." In the statistics on household composition, families are always included in one of the three major groups of two-or-more person households. Primary individuals with non-relatives living with them are tabulated as "other male head" or "female head." Primary individuals living alone are always tabulated as "one-person households."

In the category "male head, wife present, no non-relative" each household consists of the head and his wife, and other persons, if any, all of whom are related to him. "Other male head" includes households with male head, wife present, with non-relatives living with them; male heads who are married, but with wife absent because of separation or other reason where husband and wife maintain separate residences, and male heads who are widowed, divorced, or single. The "female head" group comprises households with female heads regardless of their marital status. Included are female heads with no spouse and female heads whose husbands are living away from their families, as for example, husbands in the Armed Forces living on military installations."

From 1960 to 1970 total households in owned housing units increased 19 percent while households in rented units increased 9 percent. Significant changes in owner occupancy

occurred both in the "two or more person households, male head, wife present, no non-relatives, 45 to 64 years of age" category with a 10,427 household increase, and the "one person household" category with a 1,181 household increase.

In terms of renter units and household composition the more notable changes occured in the "female head, under 65 years of age" category with a 2,854 household increase, and again the "one person households" or "primary individuals" category with a 6,622 household increase. Table 6 presents the percentage distribution of household composition by tenure, 1960 and 1970, for the Springfield-Chicopee-Holyoke SMSA.

From this, it appears that families with wife present and male heads over 45, when financially able, are continuing the trend to owning homes rather than renting. The one person households, while showing an increase in ownership will continue to require even more rental accommodations.

#### D. Vacant Housing

The adequacy of the housing supply can be measured by the number and character of vacant housing units. Rates of vacancy and their trends are useful tools in evaluating current market conditions. For a metropolitan area, vacancy rates between 4 and 6 percent are regarded as normal. Lower rates may indicate a housing shortage, while rates over 7 percent may be critical for the housing market, leading to declining rents and prices. Additionally, data on the number of persons per room of occupied dwelling units is a measure of the intensity of use of the existing housing stock. If vacancy is extremely low and overcrowding is on the rise, high intensity use results. Additional units are therefore required to relieve the market.

The 1960 and 1970 Census of Housing distinguishes between year-round and seasonal vacancies, between vacancies available for rent or sale, and other vacancies which include dwellings rented or sold but awaiting occupancy or held for occasional use. Information is also provided on standard and substandard vacant units, but for 1960 only. The most pertinent vacancy data for housing market purposes are available units -- for sale and rent.

U.S. Census of Housing, Metropolitan Housing Characteristics, Springfield-Chicopee-Holyoke SMSA, 1960 and 1970, HC (2). Source:

As a general rule, vacancy rates for rental units are higher than they are for owner-occupied units because of a faster turnover rate. Thus, vacancy rates are usually higher in those areas which have a higher percentage of rental dwellings.

Table 7 indicates that the central urban core has the highest rate of vacant-for-rent units in the region with 3.4%. It is also to be noted that the 3,261 units available for rent in this sub-area come to about 72% of all the 4,521 units for rent in the region. In view of the critical shortage of housing in this region, these relatively higher figures may reflect not only the expected faster turnover, but also the general undesirability of the rental units available.

### E. Housing Construction Activity

The usual source of information on housing construction trends is the Massachusetts Department of Labor and Industries publications on building permits issued in each city and town. There are certain problems associated with the use of building permit records. Double counting is possible because more than one building permit may be issued at different times for the same site. In some communities permits become invalid after a vear or two, vet they are counted at the time of issue. In other communities, where no time limit is set on permits, no building action may result from some permits for several years, thus distorting the rate of new housing construction. Over a long period of time some of these discrepancies will tend to balance out. It is estimated that over a ten year period about 90% of the building permits issued result in actual construction, based on field surveys. However, over a shorter period and by individual municipalities the building permit records may be misleading.

Table 8 shows that 1971 was a "good" home building year. In the region a total of 6,313 home units were authorized in 1971 compared to 3,855 units in 1970. In fact the permits for 6,313 units in 1971 was the largest number of units authorized during the past twelve years. Residential construction activity in the region since 1960 averaged 3,340 units per year. Over the past three years (1969-1971) the average was 4,800 units per year.

Since 1968 the number of multi-family units authorized for the region has outnumbered single family units (see Table 9). A total of 4,183 home units in multiple unit structures (66.2) was authorized in 1971 compared with 2,130 single-family units. This was a gain of 2,180 units in multiple unit structures over the previous year.

Table 10 shows the leading growth municipalities in terms of the total number of residential units authorized by building permits between 1969 and 1971. The municipalities shown each year are those that head the list. Together they account for over 80% of all permits issued during each of the past three years. Five municipalities remained on this list for all three years, Springfield, Chicopee, Amherst, Westfield and West Springfield.

For details of units authorized in multi-family structures see Table 11 which presents the statistics for ten municipalities with the largest number of permits issued in 1971, 1970 and 1969. In 1971 multi-family permits issued in the municipalities listed accounted for 96 percent of all multi-family permits issued in the region, 99.5 percent for 1970 and 96.0 percent in 1969.

The rapid proportionate increase in multi-family structure permits is shown for the CUC. In 1960 one-sixth (16.4%) of the permits were for multi-family units. In 1965 one-half (46.9%) and in 1971 over three-quarters (75.7%) of the permits were multi-family. This pattern is repeated in the ES sub-area, which increased from one sixteenth in 1960 (6.2%) to one sixth in 1965 (16.1%) to two-thirds in 1971 (64.3%).

The illustration on page 27 shows the residential construction trend over the past twelve years for the region and the subareas. While the total permits issued increased from 1883 in 1960 to 6313 in 1971 it can be seen that the number of permits issued for single family units remained relatively constant throughout the period.

# Residential Building Permit Trend LPVRPD And Sub-Areas 1960-1971

# IV. HOUSING CHARACTERISTICS

### A. Tenure of Housing, 1960 and 1970

During the past decade to 1970, the percentage of renter-occupied units has decreased over the preceding decade, according to the 1960-1970 census figures for the Lower Pioneer Valley Regional Planning District. In 1960 for the region, 42.2% of the occupied housing units were renter-occupied, compared with 40.1% in 1970. The major cause for this trend is the general desire of families to own their own homes. The Lower Pioneer Valley Regional Planning District as a whole has been slightly ahead of the state in owner-occupied tenure.

The region would have been considerably ahead of the state without the effect of the central urban core, which shows a significantly lower owner-occupied percentage. A further reason is the large-scale apartment development in certain suburban communities. Table 12 shows the owned/rented breakdown of housing; Table 13 shows the increased apartment (for rent) construction between 1960 and 1970 in 5 selected municipalities.

An examination of Map 3, showing owner-occupied units, and Map 4, showing renter-occupied units by municipalities, indicates the relative differences in the distribution of these categories with respect to distance from the central urbanized areas of the region.

# B. <u>Distribution of Owned and Rented Units by</u> Income Groups

Figures are available from the census for the metropolitan area showing the income levels of families living in both owner-occupied and renter-occupied housing units. This information confirms that the higher the income, the larger the proportion of home ownership. Table 14 presents the distribution of tenure by income in two ways. First, in columns (2) and (4) the percentages of owners and renters are given independently in each income range shown. Second, columns (3) and (5) show the percentage split between rented and owned units at each given level of income. For the actual figures and a more detailed breakdown of income groups see Table XVI, Appendix.

TABLE 14

DISTRIBUTION OF OWNER-OCCUPIED AND RENTER-OCCUPIED HOUSING UNITS BY INCOME GROUPS, SPRINGFIELD-CHICOPEE-

HOLYOVE SMSA 1970

Source: U. S. Census on Housing, Metropolitan Housing Characteristics, Springfield-Chicopee-Holyoke SMSA, 1970, HC(2)-211.

From this it can be seen that households with incomes under \$7,000 account for only 23 percent of owner-occupied units, whereas the same income group occupies 56 percent of the rental units. At the other end of the scale, households with incomes of over \$10,000 occupy 58 percent of the owned accommodations and 23 percent of the rental units. Only for the middle income group of \$7,000 to \$9,000 are both the owned and rented units almost equal at one-fifth. Columns (3) and (5) show the percent distribution of households living in either owned or rented accommodations at a given level of income. The inverse proportion between ownership and rental status as incomes rise is clearly illustrated.

A major difficulty in dealing with the housing is that demand is in a state of constant flux, and adjustments in supply to meet changing demands always lag because of construction delays and the life of buildings once constructed. Existing stock seldom if ever contains the exact quantity and type of housing people seek and can afford. A further difficulty is that people do not know about all available housing units.

The above distribution figures (Table 14) help to indicate several factors which will be useful in projecting housing demand in conjunction with population and income projections in the future regional planning programs. With rising incomes the overall effect on the ownership and rental markets can be inferred. The extra demand for the number of houses within different price ranges can be estimated. The effect on the type of rental units needed as a result of income changes can be deduced as well from the present distribution of income groups among the existing accommodations. These figures also indicate the degree to which the housing market fails to supply dwellings for owner-occupancy to those in the lower and moderate income levels.

Even with expected rising incomes it appears that a large section of the total households would, under present circumstances, have to rely on rental accommodations. This applies particularly to the nonwhite households. In 1970, about 65 percent of the nonwhite households lived in rental units in the region, while only 32 percent of the white households lived in rental accommodations. The main reason for the lower ownership rates of nonwhite families is lower average income. A later section of this report deals with housing of nonwhite families in the region.

#### C. Type of Structure

There are three major classes of housing structures—single units, small multi-unit structures containing two, three, or four units, and large multi-unit structures or apartment buildings. Trailers are another class of residential structure, but they are still numerically insignificant. Generally, single unit structures are almost wholly owner-occupied; apartments are rented and the units in the two-to-four unit structures are in mixed owner and rental occupancy.

Table 15, which gives data on housing units by structure in the state and the region in 1970, shows an almost equal proportion of units in single, two or more, and trailer structures in the LPVRPD and the state.

#### TABLE 15

LPVRPD	53.5%	45.4%	1.0%	185,646

Source: U. S. Census of Housing, 1970, HC(1)-A-23, and PHC(1)-205

In 1970, 53.5 percent of the regions' housing stock was in one-unit structures, compared with 55.1 percent in 1960 (see Table XV, Appendix). Apartments (5 or more units per structure) increased from 17.5 percent in 1960 to 18.9 percent in 1970, with the highest percent increases becoming evident for the first time in the east and west suburban areas, and not the CUC.

For the ES, there were 686 units (3% of the housing stock) structured as apartments in 1960. This increased to 2,439 units in apartments (7.9% of the housing stock) in 1970—an increase of 255 percent in the decade. For the WS, there were 2,496 apartment units (7%) in 1960, compared with 6,456 apartment units (15.1%) in 1970 (see Table 16) an increase of 159% in the decade.

For details of the individual municipalities see Table XV,
Appendix. Of all apartment units (dwellings in structures of
five or more units) in the region, 79 percent were concentrated
in the central cities plus Northampton and Westfield and 93
percent in the five cities plus Agawam, Amherst and West Springfield.

Among the smaller multi-unit structures, the region and all sub-areas have a larger number of two-family units than dwellings in three and four-unit structures. The ER sub-area realized the largest percentage increase in both two-unit structures (4.9%) and three and four-unit structures (2.6%) in the region.

#### D. Size of Housing Units

In this section, the total housing stock is examined in terms of the number of rooms in a unit. The distribution of units by size for the state, Lower Pioneer Valley Regional Planning District, and sub-areas are given in Table 17 to identify any significant differences in the composition of the regional housing stock.

TABLE 17

3	8,239 (8.6)	1,585 (5.1)	3,315 (7.7)	752 (6.4)	268 (5.2)	14,159 (7.6)	 (8.8)
4	21,002 (22.0)	4,314 (13.9)	8,110 (19.0)	2,345 (19.9)	694 (13.5)	36,465 (19.6)	 (17.8)
5	31,509 (33.1)	7,684 (24.9)	12,090 (28.3)	3,001 (25.5)	1,188 (23.2)	55,472 (29.9)	(24.7)
6	18,689 (19.6)	6,996 (22.6)	9,186 (21.5)	2,586 (22.0)	1,134 (22.1)	38,591 (20.8)	(21.6)
7	5,827 (6.1)	4,710 (15.2)	4,140 (9.7)	1,352 (11.5)	754 (14.7)	16,783 (9.0)	(10.9)
8 & More	4,556 (4.7)	4,562 (14.7)	3,201 (7.5)	1,280 (10.9)	967 (18.9)	14,566 (7.8)	(10.5)
TOTAL	95,141 (100%)	30,848 (100%)	42,650 (100%)	11,731 (100%)		185,485* (100%)	- <b>-</b> - (100%)

Source: U. S. Census of Housing 1970

(for individual municipal figures, see Table V, Appendix)

<sup>\*</sup>Total does not agree with either the total housing units (187,449) or the total occupied housing units (177,982) for 1970 shown in Table I, Appendix, because the 185,485 count excludes the seasonal and migratory vacant category.

The significance here is that both the central urban core and the Lower Pioneer Valley Regional Planning District figures are about equal to the state proportion of 14.2% for 1, 2 and 3-room units; greater than the state's 64.1% for 4 and 5-room units; and significantly lower than the state's 21.4% for units of 6 or more rooms. In the east suburban and west rural sub-areas, however, there are considerably more of the larger-sized units in proportion, compared to the state figure. Table 18 shows these groupings more clearly.

# E. Condition of Housing

# 1. Sound, Deteriorating, and Dilapidated

Census definitions and enumeration techniques have changed from 1960 to 1970, so that a comparison over time is not possible. The 1970 census has no categories of sound, deteriorating and dilapidated housing for comparison with 1960 census data.

# 2. Plumbing Facilities

There are three specified plumbing facilities—hot and cold piped water, flush toilet, and bathtub or

shower inside the structure. Lacking all or some plumbing facilities means a lack of one or other of these three facilities, or that the toilet or bathing facilities are also for the use of the occupants of other housing units.

Table 19 shows the numbers of units lacking such facilities for the state, Lower Pioneer Valley Regional Planning District and sub-areas. The region as compared with the state has a lower percentage of units lacking plumbing facilities (3.0% vs. 3.4%). The rural sub-areas, however, have approximately 5.5% of their housing units lacking one or more of the specified facilities. It is difficult to determine how many of the vacant units shown are available for rehabilitation and use without a field survey.

(for individual municipal figures, see Table VI, Appendix)

#### 3. Overcrowding

The second indicator of the inadequacy of existing housing is the intensity of occupancy of housing units, or the number of persons per room. In general, a unit is regarded as overcrowded if the number of persons in the household exceeds the number of rooms in the housing unit. It should be realized that this is a rough measure, because the quality of overcrowding also depends on the age and sex distribution of the household, and on the structural condition of the housing.

Unfortunately, the 1970 census does not provide any direct relationship between overcrowding and structural conditions. Overcrowding is given by owner-occupied and renter-occupied for the sub-areas, Lower Pioneer Valley Regional Planning District and the state in Table 20. It can be seen that there is an overall tendency toward over-crowding in rental accommodations in the state, the region and in the sub-areas. This is particularly noticeable in the category of units where overcrowding reaches the level of 1.5 or more persons per room.

Applying the general definition of overcrowding of more than 1.0 persons per room, Table 20 indicates that for owner-occupied units, the central urban core leads with 2,962 units out of 6,370 for the region (about 46%). renter-occupied, the central urban core also leads with 3,323 units out of 4,832 for the region (about 69%). both categories combined, this sub-area carries 6,285 units out of 11,202 for the region (about 56%). Compared with population distribution, the central urban core--with 280,693 people out of 583,031 for the region (about 48%) -it can be said that overcrowding runs somewhat higher in the central urban core than in the rest of the region. In terms of area, however, the figures indicate a much higher concentration of overcrowding in this sub-area. The 51,000 acres in Springfield, Chicopee and Holyoke combined is only 6.8% of the 750,000 acres in the Lower Pioneer Valley. It is this 6.8% of the region that is carrying 56% of the overcrowded units.

### F. Age of Housing

The age of housing is not necessarily a decisive indicator of the quality of a dwelling: it is significant only as it relates to other (quality) characteristics of the housing stock. Age alone will not measure the adequacy or structural soundness of a unit; other factors and values must also be compared in order to determine the condition of the housing stock. For example, dwellings of identical age and construction may vary widely in useful life span due to either a lack of, or careful maintenance which in many cases is a function of income. A further concern in evaluating age is neighborhood standards. Housing units in areas of higher neighborhood and municipal standards (zoning, subdivision controls, and municipal planning) will, in most cases, be less adversely affected by age than units located in areas with few or no ordinances, controls or planning.

Despite limitations, however, it still holds true that deteriorating and dilapidated structures are more likely to be found among older buildings; the quantity of older buildings in a community is considered an indication of the magnitude of the replacement or rehabilitation problems that may be faced in the future.

Details of the housing stock by year built for the state, region and sub-areas is given in Table 21. For the age distribution of housing in each municipality see Table XIV, Appendix. Table 21 indicates that the region's total housing stock was somewhat newer than that of the state in 1970. However, for the CUC the opposite is true, and in fact, within the region many appreciable differences occurred. The highest proportion (57%) of housing units less than 20 years old were in the ES sub-area. In the CUC sub-area almost two-thirds of the housing was built in 1939 or earlier.

In the last decade the highest level of residential construction took place in the suburban municipalities, where in some cases over 40 percent of the 1970 housing stock was less than ten years old.

In contrast, the cities of Springfield, Chicopee, Holyoke, Northampton and Westfield combined had less than 12 percent of their housing units built in the past 10 years. The 1970 housing stock had some 101,600 units constructed prior to 1940 and 70 percent of these (71,300 units) were in the five cities of the region.

# G. Value and Gross Rent of Housing

#### 1. Value of Owner-Occupied Housing

The value of housing recorded in the 1970 census represents the estimate of how much existing residential property, both house and land together, would sell for on the market April 1, 1970. The information is restricted to units having only one housing unit on the property and no business use. Units in multi-unit structures and trailers were excluded, as were units on farms and units on land of 10 or more acres. Therefore, the total number of housing units listed in this section, and in Table VIII, Appendix, is less than the number of owner-occupied units given in the section on tenure of housing.

A comparison of the region's owner-occupied housing values with those in the state reveals that the properties valued under \$10.000 are similar but that for the medium and high value properties significant differences are apparent. One-third of all owner-occupied housing units in the region, for which value was tabulated, are in the \$15,000 to \$20,000 price range--as compared with one-quarter for the state. In terms of high value units (\$25,000 and over), the region has 17.6% of its units in this price category compared with 30.8% for the state--some 13.2% less. Table 22 indicates the consistently lower distribution of higher housing values for the sub-areas as compared with the state proportion. The only exception is the east suburban area, which has over 36% of its units valued at \$25,000 or more. This is consistent with the higher property values associated with new construction. It is reasonable to accept the relatively rapid growth rates for total housing stock as an indication of new building. Over the period 1950 to 1960, the east suburban area showed an increase in housing units of about 70% compared with 30% for the region, and between 1960 and 1970, an increase of 38% compared with 11% for the region (see Table 1).

Source: U. S. Census 1970, First Count Summary Tape, Population and Housing
U. S. Census, General Housing Characteristics, Massachusetts,
1970, HC (1) A-23, Table 4

(for individual municipal figures, see Table VIII, Appendix)

The median values shown relate to the estimated market value of existing property and must be considered in the context of the age and condition of the housing stock. They do not indicate directly the costs of new housing construction.

Only the east suburban area has a median value exceeding that of the state as a whole, which is again consistent with the rapid rate of growth experienced in this sub-area over the past two decades. The west suburbs come in with a median value of \$18,150--some \$2,450 less than the state. This is due to the heavy concentration (35.1%) of houses in the \$15-\$20,000 range. The west rural subarea has a median value of \$15,650--some \$4,850 less than the state.

In terms of value and income, the value of housing at different levels of income of owner-occupiers in the metropolitan area does not show as distinctive a relationship between value and income as might be expected. There is only a general but not consistent correlation between income and value as is indicated in Table 23.

Only at the highest incomes of \$25,000 or more is a clear pattern established. Approximately 80 percent of these households occupy homes valued at \$20,000 or more, and over 65 percent of them occupy homes valued at \$25,000 or more. All other income groups generally had the largest proportion of ownership in the \$15,000 to \$19,999 value range which may be explained by the fact that one-third of the owner-occupied units in the region fall within this price range. The exception is that households with incomes of less than \$6,000 occupied a larger proportion of units in the \$10,000 to \$15,000 value range.

### 2. Contract Rent of Housing

Contract rent is the monthly rent agreed to, or contracted for, even if the furnishings, utilities, or services are included. The data on contract rent excludes one-family rental houses on 10 acres or more. Renter units occupied without payment of cash rent are shown separately as "without pay" under the monthly contract rent tabulations in Table IX, Appendix. Rental values have been grouped into eight ranges, from "less than \$40 (excluding no-rent)" to "\$200 or more" in Table 24, The percentage distribution of rental units by monthly contract rent is given in Table 24 to compare the distribution of rental units by rent values in the sub-areas, the Lower Pioneer Valley Regional Planning District and the state. The median monthly contract rent is also presented in this table. This median rent was based on those units having a dollar rent value--"without pay" units were excluded. As with median value figures, these median rents do not reflect the rental costs of new construction today.

Generally the same pattern of region/state comparative figures is indicated, whether for housing rents or values. The only sub-area that exceeds the median figures for the state is the eastern suburban area. Again, the west suburbs are close to the state median rent with \$87 as against \$90 a month.

Significantly, however, the region's 1970 median rent of \$76 is closer to the median rent figure of \$73 for the central urban core than to the state's \$90. In contrast, the region's median value figure (see Table 22) of \$17,900 was only \$400 below the state's median of \$18,300 and well above the central urban core median value of \$16,400-because only 33,400 (39%) of the region's 84,870 owner-occupied units were in this sub-area. For rented units, the central urban core (Table 24) contained 43,900 (66%) of the region's total of 66,900 rental units.

U. S. Census 1970, General Housing Characteristics HC (1) A-23 Table 4

\*Does not include one-family homes on 10 acres or more and units occupied without a specified rent.

(for individual municipal figures, see Table IX, Appendix)

Even more significant is the prevalence of rental units in the 5 cities, and the 3 towns of Amherst, Agawam, and West Springfield (see Table 25). The table shows the dissimilar distribution of rental ranges by municipality for about 61,000 rental units, or nearly 90% of the total rental units in the Lower Pioneer Valley Regional Planning District. Holyoke has its greatest proportion (42.3%) of rental units in the under \$60 range; Westfield has 27% of its rented units in the under \$60 range. Of the 5 cities, Springfield--with the largest number of rental units--has 36% of its units in the modal range of \$60-\$79, which dominates the rental picture for the central urban core and the entire region, as already indicated by the similarity of the median rent figures for the central urban core and the Lower Pioneer Valley Regional Planning District.

The greatest proportion of rental units in Agawam (60%) are in the \$120 to \$199 value range. Amherst is comparable with 50% of its units in this range. However, Amherst has 13.4% of its units renting for \$200 or more a month, as compared with 0.7% in Agawam.

Census 1970, Population and Mousing, First Count Summary Tape ۍ د \_ \_ Source:

Because the rental accommodations throughout the region are principally occupied by middle and low-income house-holds (see Table 14), it is of considerable importance to relate gross rents to income. In Table 26 the yearly gross rent is expressed as a percentage of the total income of the family or primary individual. The percentage is presented for the same renter-occupied units for which gross rent was tabulated; thus the statistics on gross rent as a percentage of income reflect the exclusion of rented units for which no cash rent is paid and units occupied by families or primary individuals who reported no income or a net loss. These were categorized as "not computed".

Characteristics, Springfield-Chicopee-Holyoke SMSA HC(2)-211

Lack of data does not permit the comparison of individual municipalities, but at the metropolitan area (SMSA) level it is possible to show the rent income ratios at different levels of income. In 1970 there were some 31,900 households (out of 66,450 rented units) in the metropolitan are a who paid in excess of 20 percent of their income for gross rent, and 15,600 households (nearly one quarter of all rented units) paid in excess of 35 percent of their income as rent. The worst hit were those households with incomes of \$3,000 or less. From Table 26 it can be calculated that approximately 45 percent of those spending over 20 percent on rent, and about 77 percent of those spending over 35 percent of their income for rent were in that group.

This is not surprising, since 20 percent of an annual income of \$2,000 allows only \$35 a month for rent. Regardless of size of unit, the region had only 3,400 units that rented for \$40 or less. These figures point up with stark clarity the dimensions of the housing crisis in this region. Seen in relation to the chronic unemployment figures since the 1970 census, it would appear that massive injections of federal and state subsidies for housing is essential not only to meet social need for decent homes, but also to generate economic recovery.

# H. Housing for Non-White Families

The data printouts available from the First, Second and Third Count 1970 Census Summary Tapes have the 5 racial categories of White, Negro, Indian, other specified races (includes Japanese, Chinese, Filipino, Hawaiian and Korean), and other non-specified races. The Spanish-speaking group is submerged in the White category. Since the combined total of the last 3 categories—Indian, other specified, and other non-specified is 2,267 persons out of 583,031 for this region (less than 0.4%), the Negro category becomes the only identifiable group, for all practical purposes, for this region.

There are 24,455 Blacks in the Lower Pioneer Valley; 94.2% live in the central core cities of Springfield (20,673), Chicopee (1,246) and Holyoke (1,127). 96.7% of the total live in these 3 cities and 3 towns--Amherst (583), Agawam (48) and West Springfield (117). The balance (661) are scattered through 21 of the remaining 37 municipalities.

The following tables show White (more accurately, non-Negro) and Negro-occupied housing units by tenure, by persons per unit, and by overcrowding.

+suppressed by the Census Bureau to preserve confidentiality at the municipal level (further individual municipal figures are not given in the Appendix) Some significant figures can be derived from these tables.

47,736 (28.0%) of the 170,600 white occupied homes in the region are in Springfield, compared with 5,924 (87.5%) of the 6,768 black occupied homes in the region (Table 27). 84,021 (49.3%) white homes are in the central urban core, compared with 6,471 (95.6%) of the region's total number of black occupied homes.

The number of white-owned homes (104,226) is over  $1\frac{1}{2}$  times the number of white-rented homes (66,374) in the region (Table 28). For blacks, the number of owned units (2,134) is less than a half the number rented (4,634). There are considerable variations in the ratio of white owned to white rented by municipality, but the black owned to rented ratio of 1 to 2 is set by Springfield and the central urban core, where black concentrations are high.

In terms of persons per unit (Table 28), blacks show a consistently higher rate than whites for the region—for both owner (4.0 to 3.4) and renter (3.2 to 2.6) occupied units. Again, the pattern set by Springfield and the central urban core dominates the picture for the region.

In terms of overcrowding (Table 28, the gross number of persons per unit is misleading: a superficial analysis would give the impression that black owner-occupied units (4.0 persons per unit) are more crowded than black renter-occupied (3.2 persons per unit). In fact, Table 29 shows the real picture. While for whites there are nearly twice as many persons living in overcrowded conditions in owner-occupied units, compared to white renters (42,771 to 25,587), the position is reversed for blacks. There are less than half the number of persons in overcrowded owner-occupied units than in renter-occupied units (1,637 to 3,814).

This could be because black renters occupy units that are much smaller, in terms of the number of rooms per unit, than

white renters. For the 364,523 white (non-negro) population in occupied units, 63,358 (or 18.6%) live in overcrowded conditions. For the 23,355 blacks in occupied units, 5,451 (or 22.5%) live in overcrowded conditions.

Any successful effort to achieve the goal of a decent home in a suitable environment for all Americans must take into account, among other considerations, the need to reduce the excessive number of whites or the excessive percentage of blacks living in homes without an adequate number of rooms for the number of occupants.

#### V. HOUSING FOR LOW AND MODERATE INCOME FAMILIES

#### A. Public Housing

The public housing program as it is known today was established by the U. S. Housing Act of 1937 to combat the economic crises of the depression. This first U. S. Housing Act created the U. S. Housing Authority and the basic provisions of the federal public housing programs. The legislation authorized the Federal Government to make construction loans, capital grants, loan guarantees, and annual contributions to local housing authorities (L.H.A.) involved in slum clearance and low-rent housing projects.

One of the functions of the early housing programs was to provide decert, safe, and sanitary dwellings for families whose incomes were temporarily reduced by the depression. It was expected that the tenants would vacate these units for private dwellings as soon as economic conditions improved. As a result, the projects did not include facilities or services designed to encourage the tenant's social or economic advancement. The original state and federal housing programs were primarily designed to provide interim housing. While the early occupants of public housing may have needed only decent, inexpensive shelter, the later occupants have manifested a need for special services—such as home counseling, health care, employment guidance and job training.

Much of the housing provided was of the "project" type containing many units—often physically and socially isolated from the rest of the community. This has resulted in social problems among project tenants because of the lack of social services and large project size. Because of these problems, the Housing Act of 1949 stressed the importance of developing sound neighborhoods while providing decent housing—not simply providing shelter. Since 1965, with the reorganization of several agencies concerned with housing and related urban problems into the Department of Housing and

Urban Development, many new types of housing programs have been developed in hopes of achieving the national goals. The 1968 Housing Act established a 10-year national housing goal of 26 million units, 6 million for those of low and moderate income. Most notable in this Act was what is commonly referred to as Section 235 and Section 236 housing. For details on the number of units constructed under these programs in the region, see Table XII, Appendix. In addition, the Operation Breakthrough program was initiated in an attempt to remove barriers obstructing large-scale housing production. In 1970, the Housing and Urban Development Act was passed. The provisions of this Act included a 2-year experimental program to demonstrate the feasibility of permitting low-income families to find rental housing of their own choice in the private housing market. The Springfield-Holyoke area has recently (April 1972) been designated by H.U.D. as a test area for this program. Act also contains a section dealing with Urban Growth and New Communities, and extends authority for Section 235 and 236 programs.

1. Housing Authorities: Organization, Purpose and Powers Under Massachusetts General Laws

A housing authority consists of five members who are responsible for policy decisions. These members may employ an executive director and staff to administer and manage operations of the housing authority. In a city, four of the five members are appointed by the Mayor with City Council approval. The initial terms must be designated as one, two, four and five years. In a town, four of the five members are elected in a town-wide election. The member receiving the highest number of votes has a five-year term, etc. (The town meeting may vote to authorize the Selectmen to appoint the four members to serve until successors can be elected at the next town-wide election.) The fifth member of the local housing authority (L.H.A.) is appointed by the Department of Community Affairs for a term

of three years. Following these initial terms in office, the successors serve for a period of five years. Members appointed or elected, as well as the state appointment, are subject to the following qualifications:

- a) must be a resident of the city or town in which they are to serve;
- b) for a city, one member of the Board must represent local labor; and,
- c) one member may be a tenant in a public housing project.

The main purpose of permitting each city or town to establish a housing authority is to allow each municipality to assume local responsibility for providing and/or managing housing for families, individuals and elderly persons of low income. When the need for public housing is determined, the City Council (with approval of the Mayor) or a town at an annual town meeting or special meeting called for the purpose of forming a L.H.A. may, by a majority vote, provide for the organization of an authority. The necessary papers and documents may be obtained from the Department of Community Affairs.

Once formed, the housing authority is empowered to undertake the following activities:

- provide housing developments for families and elderly of low income
- . provide relocation developments
- study housing needs and markets, population and income
- receive loans, grants and annual contributions from the federal and state governments or from any other sources, public or private
- take by purchase or eminent domain, lease or acquire any property determined by the housing authority to be reasonable to carry out the purpose of the Housing Authority Act
- lease, operate or revise schedules of rents for any project

An authority cannot receive federal or state funds for a low-rent housing project without the approval of the

Mayor in a city or the Chairman of the Board of Selectmen in a town and the agreement and approval of a project by either the Department of Housing & Urban Development (H.U.D.) or the Department of Community Affairs (D.C.A.) Occupancy in a L.H.A's project is restricted to lower income families, including elderly individuals (62 years and older), the handicapped, and persons and families displaced by urban renewal or other government action. Income limits for admission and continued occupancy are set by the local housing authority under federal guidelines for federal projects, and state quidelines for state-assisted projects. The authority also establishes the rents which are based on the tenants' ability to pay rather than the actual value of the unit. Rents are lowered through a combination of federal and local subsidies which in effect results in public housing rents which approximate the monthly operating costs. Recently, however, with the Brooke Amendment, the federal government can subsidize -- in addition to development, principal and interest costs--part of the yearly operating costs in those instances where rents exceed 25% of the lowest income families.

2. Types of Programs: Methods of Construction and Acquisition

The above provides a general description of the provisions of the public housing program which apply to both the conventional methods of construction, used since passage of the 1937 Act, and to the turnkey techniques developed in the mid-1960's. A third approach—the leased housing program authorized by the 1965 Housing Act—relies on the leasing of existing housing which is either privately or publicly owned. The basic policies and procedures governing these methods are outlined below.

<u>Conventional Projects</u>. Most of the public housing development in the region has been of this type. Under this method, the L.H.A. acts as its own developer. The authority selects the housing site, obtains proper zoning, employs

its own design team, and when plans are complete, takes competitive bids and awards the construction contract to the lowest eligible bidder, subject to H.U.D. or D.C.A. approval.

Turnkey Projects. Under the turnkey method, the housing authority contracts with private developers, builders or rehabilitators, to purchase upon satisfactory completion, housing they have built or rehabilitated. The main advantage of turnkey over the conventional approach is considerable savings in development time. The developer, rather than the L.H.A., handles such time-consuming steps as site acquisition, preparation of plans, re-zoning petitions, and awarding of competitive bids.

Leased Housing. Section 23 of the U. S. Housing Act of 1937, added by Section 103(a) of the Housing and Urban Development Act of 1965, provides one of the most versatile approaches available for meeting the housing needs of low-income families. (The state has a similar program—Chapter 707.) Under the legislative authorization, federal (state) financial assistance in the form of annual contributions is given to local public housing agencies to make privately-owned dwellings available to families of low income at rents they can afford.

In addition to local housing authorities, any state, county, municipal or other governmental agency authorized to engage in the development of administration of low-rent housing or slum clearance may also undertake a leasing program. The operation of the program must be authorized by resolution of the local governing body of the locality in which units are to be leased.

The legislation indicates a preference for scattered site housing, but authorizes local authorities themselves to waive this provision. The type of housing may be single family, row house or apartment units in multifamily structures. The same rent schedules and income

limits as those applied in other low-rent housing operated by the local authority may, but need not, be used. The tenant selection can be made either by the owner, the L.H.A. or by the owner from lists of eligible applicants provided by the authority.

The leased housing program provides a method of satisfying the housing needs of low-income families as well as a method for landlords to improve the physical condition of their structures. Public housing makes payments to the municipality in lieu of taxes--a sum determined by the city or town and the authority. Section 23 housing gives the low-income family the same benefits as public housing, and the structures, through rehabilitation, are not removed from the market but rather continue to pay taxes. The overall result is that the municipality gains in tax revenue, and the people gain by obtaining safe, sanitary and decent housing. The landlords who enter into this program are given an "intent to lease" which is used as the tool to acquire loans from local banks to rehabilitate the structures so as to raise them to specifications. The leases run from one to 10 years, and the profit allowed the landlord is somewhere around 6%.

This Section 23 leased housing program is, in a sense, a slum clearance program—but one utilizing rehabilitation rather than demolition. This program is aimed at helping out the landlord so that he can operate at a profit, allows low—income people to live under improved living conditions at rents they can afford, offers incentive to bring structures up to a safe, sanitary and decent condition, and lastly allows the municipality to benefit in that the tax situation is improved.

Other Public Housing Programs. Additional public housing programs which can be undertaken by a local authority to acquire public housing units include purchase and rehabilitation of existing units, and combined public/private ownership of a housing project. Under the Turnkey II Program, the local housing authority can turn over the management

aspect of a low-rent, publicly-owned housing project to a private firm.

The programs indicated above are aimed primarily at rental housing owned or operated by public housing authorities. The Housing Act of 1968 has extended the opportunities for home-ownership by permitting the public housing tenants to purchase condominium apartments as well as detached or semi-detached homes. The 1968 Act also allows the local authority the opportunity to purchase or construct housing units for re-sale to low-income tenants. This method is known as Turnkey III.

#### B. Public Housing in the LPVRPD

#### 1. Existing Public Housing Stock

There are 5,167 units of low-rent, public housing in the region under management by the local housing authorities. In 1965, there were 3,635 units of public housing, 2.3% of the total occupied housing units in the region. This has increased to 3.0% in 1971. As of 1965, approximately one third (35.3%) of the region's public housing units were constructed under federal programs; whereas in the state as a whole, almost one half (48.0%) of all low-rent public housing was provided with federal aid. In 1971, the federally-aided projects increased to 43.0% in the LPVRPD and 52.8% for the state as a whole (see Table 30).

<sup>\*</sup>does not include units under leased housing or rental assistance programs

Twenty-one of the 43 municipalities in the region have established a local housing authority, 16 of which have provided public housing. This means that all communities of over 10,000 population -- with the exception of Longmeadow--have a local housing authority and provide lowincome public housing. The towns of Granby, Hadley, Southwick, Belchertown, Hatfield, Monson and Ware, of under 10,000 population, have housing authorities. Of these towns, to date, Hadley, Belchertown and Palmer have provided public housing. The detailed tabulation of the number of public housing units by the various state and federal programs and by community are shown in Table 31; the location of public housing projects is shown on Map 5 of this report. Only 4 cities have used federal aid for the provision of public housing in the region. They are the 3 cities of the central urban core, and the City of Northampton--the 4 largest communities in the region. It appears that the primary reason for the preference, particularly in the smaller communities, for the state programs is that it is administratively easier to obtain the necessary approvals. So far, it is only the larger municipalities with greater administrative capacity which have taken advantage of the federal programs.

Of the total public housing units, 75% are provided in the 3 central cities and 85% in the 5 cities of the region. There is a heavy emphasis on the provision of housing for the elderly. Forty-six percent of all public housing units have been constructed for the elderly in the combined state and federally-aided programs; in fact, 8 of the 16 communities provide only public housing for the elderly. In the region, this trend of providing elderly public housing has been very pronounced.

Source: Lower Pioneer Valley Regional Planning Commission data and Local Housing Authorities

Of all the public housing units constructed since 1960 (3,020), almost 65% (2,232) were constructed specifically for the elderly. Only Springfield (568) and Chicopee (220) have built any non-elderly public housing units since 1960. For detailed figures of public housing provided before and after 1960, see Table XI, Appendix. All of the communities, with the exception of Easthampton, constructed more units since 1960 than before; Springfield almost doubled its stock of public housing; and Chicopee, Westfield and Agawam more than doubled their public housing units since 1960.

The initial public housing projects were mainly to provide inexpensive shelter for those who could not financially afford suitable housing. Because it was felt that better management could be provided if all units were in one structure, rather than on scattered sites, the large "project" type of development resulted. The projects of large size in the region and some of the first to be constructed consisted of 226 veteran units (1951) in Chicopee; 167 units (1939) and 219 units (1943) for low income families, and 219 veteran units (1951) in Holyoke; and 200 veteran units (1949). 332 veteran units in two projects (1951), and 388 low income and elderly units (1963) in Springfield. Since this time (1963), most of the public housing projects have been on a smaller scale, averaging somewhere around 50 units per project, and with the leased housing program, scattered single units are being located throughout the areas of L.H.A. jurisdiction, especially in Springfield and Holyoke. For details by municipality, by public housing project name, type and number of units, street location, funding agency and year built, see Table XIII, Appendix, and Map 5, Housing Development at the end of this report. The scattered development and smaller sites have not produced particular management problems and, in fact, this type of development seems to increase the tenant's sense of responsibility because of their removal from the "project environment." While it may be necessary in the central urban core to develop extensive projects, because of economic factors, it appears that in this region as a whole emphasis should be on smallsite public housing development as suitable means of providing public housing to those in need throughout the region. This includes low income families -- not just the elderly.

In the LPVRPD, consisting of 43 cities and towns, the 5 cities and 3 towns of Agawam, Easthampton and West Springfield provide low income family public housing accommodations. The above-mentioned municipalities also provide

elderly housing along with 8 additional towns (see Table XI, Appendix). This leaves 22 municipalities which have neither a local housing authority nor public housing.

### 2. Income Limits for Public Housing

The local housing authorities in the region establish the income limits for admission to and continued occupancy of its public housing, subject to state or federal approval. The income criteria for eligibility can vary among the authorities, but generally the income is figured on the family's gross income less any allowable deductions such as social security and \$100 deductible for each minor child in the family. Table 32 compares the admission limits set by the five largest authorities in the region whose local governments represent almost 60% of the total population in the LPVRPD. Most of the city-wide housing authorities have established special income limits for families and individuals displaced by public action and for elderly (62 years and older) or handicapped persons. These limits are set at 120% of the regular limits for admission.

Generally, the local authorities allow overincome families to remain in the public housing unit for a
reasonable time until private housing accommodations can be
located. During this time, their rents are set at the maximum rate of the local housing authority--usually 20 to 25%
of the annual income. If the public housing authority
determines that, due to special circumstances, the family
is unable to find decent, safe and sanitary housing within
its financial reach, although making every reasonable effort
to do so, then the family may be permitted to remain for the
duration of such a situation if it pays an increased rent
consistent with such family's increased income.

#### TABLE 32

MAXIMUM INCOME LIMITS FOR ADMISSION TO FAMILY PUBLIC HOUSING BY SELECTED LOW-INCOME FAMILY SIZES FOR THE HOUSING AUTHORITIES IN THE FIVE CITIES 1972

<u>Municipality</u>	l Person Family	4 Person Family	7 Person Family	10 or More Person Family

(1) only state program; no federal public housing

#### 3. Public Housing Needs in the LPVRPD

To arrive at an estimate of overall regional needs for public housing units, several factors must be considered. Some guidance has been made available through the local housing authorities in terms of waiting lists, turnover of units, and proposed additional public housing activity. Other factors to be considered are the number of low-income families and the family size, how many of them live in unsuitable housing units—determined through evaluation of condition factors as reported in 1970 Census of Housing, and the number of low-income family renters with high rent to income ratios.

According to the information received from the local housing authorities, there is a current waiting list of 3,893 eligible applicants. This covers only the 16 municipalities with a housing authority and public housing units in existence.

It should be realized that part of this information is based on estimates, since not all housing authorities keep formal waiting lists. In any case, the size of the waiting lists indicates that there are more applicants than there are available housing units. The turnover of

units varies from community to community and also depends on the type of public housing. From the limited information available, it appears that the turnover of veterans' housing and low-income housing runs at 10 to 12% of total units (2,887) or approximately 290 units per year. The turnover of elderly housing is considerably lower, about 1.5% of the total units (2,587) or 39 units. At this rate there appears to be a total turnover of public housing units of approximately 330 per year in the 16 municipalities with units under a L.H.A. According to data collected from the local housing authorities, the number of applicants on waiting lists increased by 800 from 1969 to 1970. The turnover, therefore, only satisfies a very small proportion of the annual applications received. Based on this, the present waiting lists indicate a need of approximately 4,000 additional units or more.

Another method of estimating the public housing needs of the region is to start from the eligibility requirements for admission to public housing. Income is the prime determinant for eligibility. A family should spend no more than 25% of its income for housing.

C. Privately-Sponsored Rental and Cooperative Housing Up to 1959, all federally subsidized housing projects were owned and operated by local public housing authorities. The Housing Act of 1959 (P.L. 86-372) under Title II, Section 202 provided that federally-subsidized housing could be developed through non-profit and/or limited dividend organizations. Through direct 100% of development costs loans from the Department of Housing & Urban Development, rental or cooperative housing for the elderly or handicapped could be developed by such organizations. The loans were made originally at a rate based on the average interest rate on all governmental obligations. The 1965 Housing Act amended the Section 202 program to limit the interest rate to no more than 3%.

The Housing Act of 1961 (P.L. 87-70) Section 221(d)(3) below-market-interest-rate (BMIR) amplified the Section 221 mortgage insurance program for displaced families to provide more liberal terms and to broaden the program to apply to low and moderate income families generally. The 221(d)(3) program authorized the Federal National Mortgage Association (Fannie Mae or FNMA) to purchase the mortgage loans (made to limited-dividend, cooperative corporations and non-profit groups) at low interest rates based on the average interest paid on the outstanding federal debt. The 1965 Housing Act also limited the interest rates to no more than 3%.

In addition to the provision of financial assistance for the development costs of housing projects, the 1965 Housing Act (P.L. 89-117) established the rent supplement program. This program authorizes the Secretary of Housing & Urban Development to make, and contract to make, annual payments to a "housing owner" on behalf of "qualified tenants"-that is lower income families who are elderly, handicapped, displaced, victims of a natural disaster, or occupants of substandard housing. This new assistance technique was developed to provide housing assistance according to the needs of individual families rather than to subsidize the development costs. This program provides that eliqible lower income tenants pay no more than 25% of their adjusted income for rent. The federal government meanwhile provides the difference in rent between the 25% paid by the tenant and the full market rent.

In 1968 two new innovative techniques were developed in terms of federal housing assistance. Under the Housing Act of 1968, Section 236, Rental and Cooperative Housing for Lower Income Families—Interest Reduction Payments, FHA insures private lenders against losses on mortgage loans to finance acquisition, rehabilitation and new construction of rental and cooperative housing for lower income families. In addition, FHA makes interest reduction payments to the lenders in order to enable lower rental charges. The interest

reduction payments to the lenders on behalf of the mortgagors will reduce rentals to a basic charge, and a tenant or cooperative member will either pay the basic charge or such greater amount as represents 25% of his income, but not in excess of the charges which would be necessary without any interest-reduction payments. The interest reduction payment to the lender can be in an amount not exceeding the difference between the monthly installment for principal, interest and mortgage insurance premium and the monthly payment for principal and interest the mortgagor would be obligated to pay if the mortgage were to bear interest at the rate of 1% per year.

Generally, tenants who pay less than the fair market rental charge for their units will have to have incomes, at the time of initial rent up of the project, not in excess of 135% of the maximum income limits that can be established in the area for initial occupancy in public housing units.

Section 235, Homeownership for Lower Income Families—Interest Subsidy is similar to the Section 236 program in terms of assistance, but it is for lower income families seeking homeownership. This program reduces the mortgage interest as low as 1% and extends the mortgage repayment period for up to 40 years. Table XII, Appendix, lists the Section 235 homes and Section 236 rental accommodations constructed in the district by municipality.

The interest subsidy assistance payment is available for a purchasor having an income, at the time of his initial occupancy, not in excess of 135% of the maximum income limits that can be established in the area for initial occupancy in public housing.

These programs are aimed at low and moderate income families with incomes that exceed the public housing limits but who cannot afford private, standard housing.

Table  $^{33}$  illustrates the family income limits for FHA Sections 235 and 236 housing for the counties of Hampden

and Hampshire. Where a municipality has public housing, the Section 235 and 236 income limits are determined to be 135% of those public housing limits. Where no public housing exists, the county family income limits apply.

#### D. State Housing Activity

In 1965 the Special Commission on Low-Income Housing submitted its report, "Recommendations of the Special Commission on Low Income Housing" to the Legislature, which led to the establishment of the Massachusetts Housing Finance Agency (MHFA.) This new agency, established by Chapter 708 of the Acts of 1966, is an independent state agency in the Department of Community Affairs, but is not subject to the supervision or control of that or any other department. MHFA is authorized to make first mortgage loans to finance the building or rehabilitation of multi-dwelling housing projects designated and planned to be available at low and moderate rentals for persons and families of low income, as defined in the MHFA statute. MHFA's funds are derived from the sale of tax-exempt bonds and notes, and its lending rates are determined by the amount which it pays in the bond market upon issuance of such securities. At least 25% of the units in each project must be made available to persons and families of low income.

The objective of the Massachusetts Housing Finance
Agency is to finance the development of housing which
will, from the time of its initial occupancy, be responsive to the most critical housing needs of the housing
market area which it will serve and which will, throughout
its intended life:

- . be perceived as well-designed and constructed,
- be responsive to the needs and tastes of its occupants,
- constitute a positive contribution to the physical, social and economic development of the community,
- provide housing for persons and families of low income, and
- achieve social and economic integration.

As a further step towards solving the housing shortage for low and moderate income families, an Act providing for the construction of low or moderate income housing in cities and towns in which local restrictions hamper such construction became law under Chapter 774 of the Acts of 1969.

The intent of Chapter 774 is to stimulate the construction of low and moderate income housing in the suburban communities. The only builder-developers who have recourse to the provisions of 774 are public agencies, non-profit corporations, and limited dividend corporations. The private for-profit builder-developer is not eligible for assistance under this Act.

Complete information pertaining to procedures, eligibility and criteria guidelines is contained in the Commission report, "Location of Low and Moderate Income Housing Sites," March 1970.

- E. <u>Regional Approach for Housing Low-Income Families</u>
  In 1970, the Commission formed the Citizens' Advisory
  Committee on Housing. One of the primary goals of the
- (1) Operations Handbook, MHFA, Boston, Mass., July 1969

Commission is the development of programs and policies eventually resulting in the realization of a decent house-in a suitable living environment -- for every family. But this the Commission cannot do alone. Active participation by informed citizens is needed, along with the utilization, in a positive way, of the leadership and organizations that can effectively assist in the Commission's efforts. The Advisory Committee has assisted the Lower Pioneer Valley Regional Planning Commission in defining and realizing specific problems and thus setting more meaningful planning objectives to be achieved through the Commission's annual work program. In this way, the Committee has and will continually assist the Commission in developing housing-related plans and proposals which will reflect, to the greatest possible degree, the goals, aspirations and choices of all segments of the regional community.

Notable among the problems are the following:

- the central core and satellite cities (Northampton and Westfield) contain a disproportionate share of the public housing (83%) in terms of population (58%).
- . the housing industry delivered approximately 28,000 units to the region over the decade 1960-1969. The report of the Douglas Commission on housing documents a national need of 26 million units in the 10 years from 1968; pro-rated to this region in simple terms of population, 75,000 units will be required in the next decade--nearly 3 times the rate of production over the past 10 years.
- a wide-spread lack of public knowledge and use of housing programs, code enforcement programs, tenant rights and responsibilities.

Because of the many problems and obstacles that have become apparent—from the lack of a local housing authority in a community, to not providing for apartment development which would more readily allow for Section 236 programs, for example—it has become clear that communities should plan for all types of residential development for families of varying income. This can be accomplished through adequate planning and the provision of suitable development tools—

namely, zoning and subdivision controls. A community could also designate sites suitable for subsidized multi-family housing (land bank), foster the organization of sponsor groups, and in general plan for, rather than oppose, such development. In this way, by emphasizing the development of the total residential community, rather than individual houses, adequate provision of housing becomes possible.

To this end, at the regional level, continuous monitoring of regional housing needs is a necessary undertaking. There is no other agency which is in a position to forecast housing development throughout the two-county area, assess the regional needs for public programs and assist in their integration at the local level.

One of the current tasks of the Commission is to designate vacant land suitable for residential development throughout the region. This should assist in the distribution of adequate housing in terms of locational choice and cost for every family.

Estimates presented earlier clearly indicate that the existing stock of all housing, including public and subsidized units, is inadequate to deal with the region's housing needs. If the national goal and regional needs are to be satisfied, without overwhelming individual municipalities with residential development, concerted and cooperative action must be taken by all the municipalities of the region with the help and guidance of the regional planning commission.
